

SOLVING THE FUTURE

PURPOSE AND VISION

Lyntek commitment is to bring the best solutions to customer needs making their business more reliable, profitable, safe, smart and capable to share the benefits globally.

VALUES

- Trust and confidence building
- · High quality and integrity standards
- Teamworking and innovation
- · Caring of customers and each other
- · Customer satisfaction and results delivering

TECHNOLOGY & INNOVATION -

Technical safety

Lyntek struggles to enable safe, reliable and enhanced performance in customers operations. Through world-class technical assurance, advisory and operations management services, Lyntek helps customers to perform on time and to budget your productive operations, even in the most demanding environments.

Big Data has the potential to solve big problems

 in public health, medicine, science, agriculture, engineering, business a more. But Big Data is too big, too fast, and too hard for traditional Information Technology to process.

So we're inventing new technologies

Risk management and optimization

In this scope, from runnig of an extensive logistics supply chain to zooming inside on operation of a specific equipment of its production process, on start Lyntek's proprietary processes and methods perform effectively scanning on past and present operations to identify possible potential disruptive or overcosting hidden triggers, which if found will have on next step their likelihood and consequences measured to be ranked as a candidate to be mitigated on a stage where these strategies are designed and deployed according to their costs versus their results to the optimization of the whole process whatever it be.

Feedback and quality

On the sequence, the results are measured, analyzed and adjusted for improvement on agility, efficiency, safety and/or profitability to upgrade continuously the operational quality.

Integrated action

Lyntek has been very successfully and largely applying this methodology not only on supply chain and equipment operations but also on their project risk prevention, recovery program, maintenance centered on reliability, forecasting, and transport optimization to avoid delays and to improve routing and scheduling of fleets.
